LECTURE 1

Displaying Text

Fonts

- A font is a complete set of letters, numbers, symbols, and characters of a single style. Here is an example of the same sentence printed in different fonts:

Programming is fun!

Programming is fun!

Programming is fun!

PROGRAMMING IS FUN!

Programming is fun!

Programming is fun!

pygame.font.init() and pygame.font.quit()

- In pygame system. The display, font, and many other canvas painting function has their own controllers. The controllers have a init() function and a quit() function.   The init() function is to initialize the initial condition. The quit() function is used to clean up the settings for the controllers.

pygame.font.init()

- Initialize the font module.

pygame.font.quit()

- Uninitialize the font module.

Set Up Fonts

```
# set up fonts
basicFont = pygame.font.SysFont(None, 48)
```

- We create a pygame.font.Font object (which we will just call Font objects for short) by calling the pygame.font.SysFont() function.

- The first parameter is the name of the font, but we will pass the None value to use the default system font.

- The second parameter will be the size of the font. In this example, we want the font size to be 48 points.

Demo Program: Display Text
font0.py

Go PyCharm!!!

```python
import pygame, sys
width, height = 240, 480
cycle_time    = 200

def draw_message(surface, myfont, color, position, message):
    label = myfont.render(message, 1, color)
    surface.blit(label, position)

def drawWindow(title):
    pygame.init()
    pygame.font.init()   # initialize the font module
    root = pygame.display.set_mode((width, height))
    pygame.display.set_caption(title)
    myfont = pygame.font.SysFont("Calibri", 36, True, False)
    while True:
        for event in pygame.event.get():
            if event.type == pygame.QUIT:
                pygame.font.quit()   #unitialize the font module
                pygame.quit()
                sys.exit()
        draw_message(root, myfont, (255, 255, 0), (20, 100), "Hello World!")
        pygame.time.delay(cycle_time)
        pygame.display.update()
    pygame.font.quit()   #unitialize the font module
    pygame.quit()

if __name__ == "__main__":
    drawWindow("Simple Font Demo")
```

Text Rendering

LECTURE 1

The Render Method

```
# set up the text
text = basicFont.render('Hello world!', True, WHITE,
BLUE)
textRect = text.get_rect()
```

- The Font object that we have stored in the basicFont variable has a method called render().

- This method will create a Surface object with the text drawn on it.

- The first parameter to render() is the string of the text to draw.

- The second parameter is a boolean for whether or not we want anti-aliasing.

The Render Method

```
# set up the text
text = basicFont.render('Hello world!', True, WHITE,
BLUE)
textRect = text.get_rect()
```

- The 3rd parameter is the color of the text.

- The 4th parameter is the color of the background.

- The second line creates a rectangle around the text.

Blit the Text Onto the Surface

```
# draw the text onto the surface
windowSurface.blit(text, textRect)
```

- The blit() method will draw the contents of one Surface object onto another Surface object.

- This will draw the "Hello world!" text (which was drawn on the

- Surface object stored in the text variable) and draws it to the Surface object stored in the windowSurface variable.

- Remember that the text object had the "Hello world!" text drawn on it.

Anti-Aliasing

- Anti-aliasing is a technique for making a

- drawing look less blocky.

- Anti-aliasing can make your text and lines look blurry but smoother.

- It takes a little more computation time to do anti-aliasing, so although the graphics may look better, your program may run slower (but only just a little).

Aliased   Anti-aliased
Demo Program: Display Text and Clear
font1.py

Go PyCharm!!!

Demo Program: font1.py

```python
import pygame, sys
width, height = 240, 480
cycle_time    = 200

def draw_message(surface, myfont, color, position, message):
    label = myfont.render(message, 1, color)
    surface.blit(label, position)

def clear_window(surface):
    global width, height
    pygame.draw.rect(surface, (0, 0, 0), (0, 0, width, height))
```

```python
def drawWindow(title):
    pygame.init()
    pygame.font.init()   # initialize the font module
    root = pygame.display.set_mode((width, height))
    pygame.display.set_caption(title)
    myfont = pygame.font.SysFont("Calibri", 36, True, False)
    while True:
        for event in pygame.event.get():
            if event.type == pygame.QUIT:
                pygame.font.quit()    #unitialize the font module
                pygame.quit()
                sys.exit()
            elif event.type == pygame.KEYDOWN:
                if event.key == pygame.K_c:
                    clear_window(root)
                    continue
                elif event.key == pygame.K_SPACE:
                    draw_message(root, myfont, (255, 255, 0), (20, 100), "Hello World!")
                    continue
        pygame.time.delay(cycle_time)
        pygame.display.update()
    pygame.font.quit()    #unitialize the font module
    pygame.quit()

if __name__ == "__main__":
    drawWindow("Simple Font Demo")
```

Text Font Attributes

LECTURE 1

Attributes

```
textRect.centerx = windowSurface.get_rect().centerx
textRect.centery = windowSurface.get_rect().centery
```

- The pygame.Rect data type (which we will just call Rect for short) makes working with rectangle-shaped things easy.

- Use your chart!

Attributes

pygame.Rect Attribute	Description
myRect.left	The int value of the X-coordinate of the left side of the rectangle.
myRect.right	The int value of the X-coordinate of the right side of the rectangle.
myRect.top	The int value of the Y-coordinate of the top side of the rectangle.
myRect.bottom	The int value of the Y-coordinate of the bottom side of the rectangle.
myRect.centerx	The int value of the X-coordinate of the center of the rectangle.

Attributes

`myRect.centery`	The int value of the Y-coordinate of the center of the rectangle.
`myRect.width`	The int value of the width of the rectangle.
`myRect.height`	The int value of the height of the rectangle.
`myRect.size`	A tuple of two ints: (width, height)
`myRect.topleft`	A tuple of two ints: (left, top)
`myRect.topright`	A tuple of two ints: (right, top)
`myRect.bottomleft`	A tuple of two ints: (left, bottom)
`myRect.bottomright`	A tuple of two ints: (right, bottom)
`myRect.midleft`	A tuple of two ints: (left, centery)
`myRect.midright`	A tuple of two ints: (right, centery)
`myRect.midtop`	A tuple of two ints: (centerx, top)
`myRect.midbottom`	A tuple of two ints: (centerx, bottom)

Demo Program:
pygameHelloWorld.py
1. All static text/object drawing.
2. Not dynamic text drawing.

```python
import pygame, sys
from pygame.locals import *

# Set up pygame.
pygame.init()

# Set up the window.
windowSurface = pygame.display.set_mode((500, 400), 0, 32)
pygame.display.set_caption('Hello world!')

# Set up the colors.
BLACK = (0, 0, 0)
WHITE = (255, 255, 255)
RED = (255, 0, 0)
GREEN = (0, 255, 0)
BLUE = (0, 0, 255)

# Set up the fonts.
basicFont = pygame.font.SysFont(None, 48)

# Set up the text.
text = basicFont.render('Hello world!', True, WHITE, BLUE)
textRect = text.get_rect()
textRect.centerx = windowSurface.get_rect().centerx
textRect.centery = windowSurface.get_rect().centery

# Draw the white background onto the surface.
windowSurface.fill(WHITE)

# Draw a green polygon onto the surface.
pygame.draw.polygon(windowSurface, GREEN, ((146, 0), (291, 106), (236, 277), (56, 277), (0, 106)))
```

```python
# Draw some blue lines onto the surface.
pygame.draw.line(windowSurface, BLUE, (60, 60), (120, 60), 4)
pygame.draw.line(windowSurface, BLUE, (120, 60), (60, 120))
pygame.draw.line(windowSurface, BLUE, (60, 120), (120, 120), 4)

# Draw a red ellipse onto the surface.
pygame.draw.circle(windowSurface, BLUE, (300, 50), 20, 0)

# Draw a red ellipse onto the surface.
pygame.draw.ellipse(windowSurface, RED, (300, 250, 40, 80), 1)

# Draw the text's background rectangle onto the surface.
pygame.draw.rect(windowSurface, RED, (textRect.left - 20, textRect.top - 20, textRect.width + 40, textRect.height + 40))

# Get a pixel array of the surface.
pixArray = pygame.PixelArray(windowSurface)
pixArray[480][380] = BLACK
del pixArray

# Draw the text onto the surface.
windowSurface.blit(text, textRect)

# Draw the window onto the screen.
pygame.display.update()

# Run the game loop.
while True:
    for event in pygame.event.get():
        if event.type == QUIT:
            pygame.quit()
            sys.exit()
```

    pygame.font.quit()    # unitialize the font module
    pygame.quit()
```

Running Text

LECTURE 1

Running Text

1. Clear the previous location.

2. Add assign a new label body to the label holder.

3. Provide vertical running or horizontal running modes.

4. Provide looping or non-looping modes.

Demo Program:
font4.py

Go PyCharm!!!

```python
import pygame, sys
from pygame_text import *
width, height = 640, 480
cycle_time = 100

def move_label(root, myfont, color, label, x, y, vertical=True, loop=True):
    global height
    label.clear()
    if (vertical):
        if (not loop): y = y + 5
        else: y = (y+5) % height
    else:
        if (not loop): x = x + 5
        else: x = (x+5) % width
    label = Label(root, myfont, color, (x, y), label.getMessage())
    label.draw()
    return (label, x, y)

def clear_block(surface, x, y, w, h):
    pygame.draw.rect(surface, (0, 0, 0), (x, y, w, h))

def clear_window(surface):
    global width, height
    clear_block(surface, 0, 0, width, height)
```

```python
def drawWindow(title):
    pygame.init()
    pygame.font.init()   # initialize the font module
    root = pygame.display.set_mode((width, height))
    pygame.display.set_caption(title)
    myfont = pygame.font.SysFont("Calibri", 36, True, False)
    x = 20
    y = 100
    x1 = 20
    y1 = 200
    c1 = (255, 255, 0)
    c2 = (0, 128, 255)
    labelA = Label(root, myfont, c1, (x, y), "Moving")
    labelB = Label(root, myfont, c2, (x1, y1), "Label")
    moving = False
    while True:
        for event in pygame.event.get():
            if event.type == pygame.QUIT:
                pygame.font.quit()   # unitialize the font module
                pygame.quit()
                sys.exit()
            elif event.type == pygame.KEYDOWN:
                if event.key == pygame.K_SPACE:
                    moving = True
                    continue

        if (not moving):
            labelA.draw()
            labelB.draw()
        else:
            (labelA, x, y) = move_label(root, myfont, c1, labelA, x, y, True, True)
            (labelB, x1, y1) = move_label(root, myfont, c2, labelB, x1, y1, False, True)

        pygame.time.delay(cycle_time)
        pygame.display.update()
    pygame.font.quit()   # unitialize the font module
    pygame.quit()
```
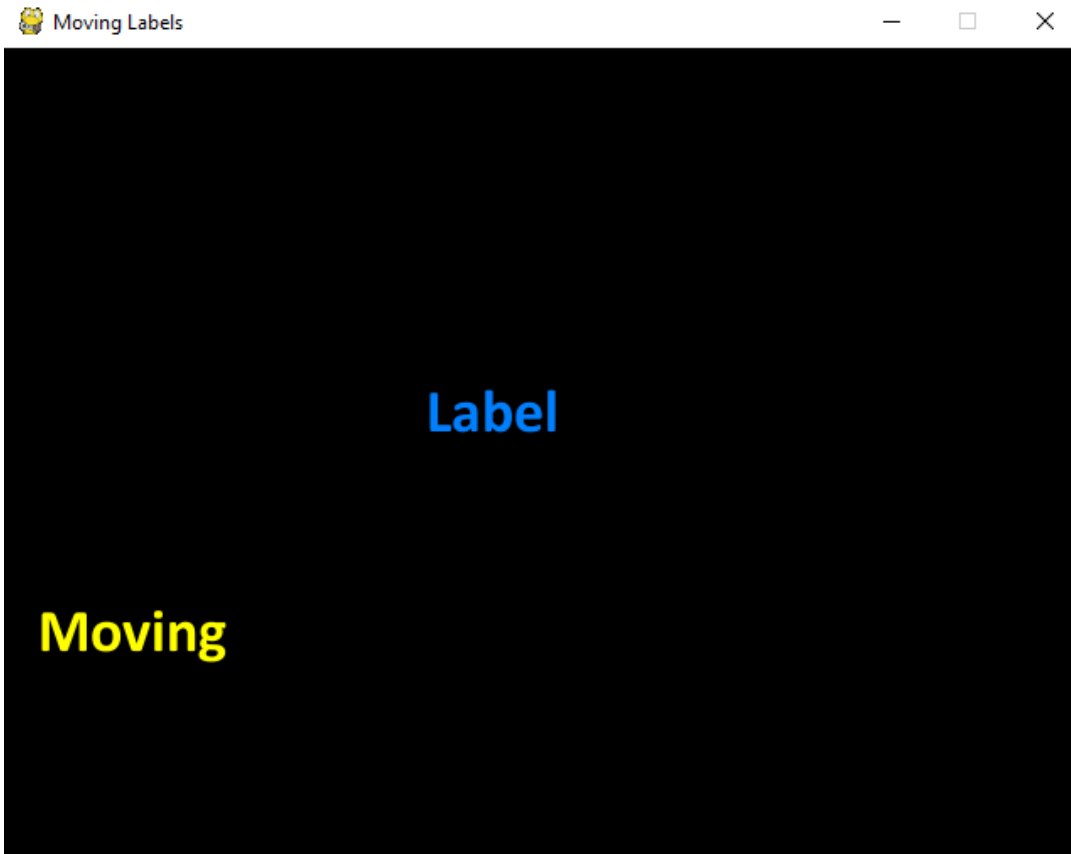

Using pygame_color.py and pygame_color_simple.py

Demo Program: font5.py

```
1    import pygame, sys
2    import pygame_color_simple as colors
3    from pygame_text import *
4    width, height = 640, 480
5    cycle_time = 100
```

Using the colors from pygame_color_simple.py

```
37        c1 = colors.yellow
38        c2 = colors.uci_blue
```

Using pygame_color.py

Demo Program: font6.py

Using pygame_color.py

```
1    import pygame, sys
2    from pygame_color import *
3    from pygame_text import *
4    width, height = 640, 480
5    cycle_time = 100
37           c1 = colors['yellow']
38           c2 = colors['dodgerblue1']
```

pygame.Rect.unionall	—	the union of many rectangles
pygame.Rect.unionall_ip	—	the union of many rectangles, in place
pygame.Rect.fit	—	resize and move a rectangle with aspect ratio
pygame.Rect.normalize	—	correct negative sizes
pygame.Rect.contains	—	test if one rectangle is inside another
pygame.Rect.collidepoint	—	test if a point is inside a rectangle
pygame.Rect.colliderect	—	test if two rectangles overlap
pygame.Rect.collidelist	—	test if one rectangle in a list intersects
pygame.Rect.collidelistall	—	test if all rectangles in a list intersect
pygame.Rect.collidedict	—	test if one rectangle in a dictionary intersects
pygame.Rect.collidedictall	—	test if all rectangles in a dictionary intersect

rectObj.inflate(x_offset, y_offset) function

- rectObj.inflate(x_offset, y_offset) returns another rectangle, so you are rebinding the name 'rectObj' to the new rectangle.

- If x_offset is greater than 0, the width will be increased by x_offset.

- If y_offset is greater than 0, the height will be increased by y_offset.

Button class

- **draw()**: draw or redraw the button.

- **getBox()**: get the rect() (defined in pygame) area
  - **getBox().collidepoint(event.pos)** will check if the mouse click inside the button area.

- **connect(function)**: connect the action function with the button.

- **onClick()**: take action when the button area is clicked.

```python
class Button(Label):
    def __init__(self, surface, myfont, fore_ground, back_ground, position, message,
                 padding_x=4, padding_y=4, width=0, height=0):
        super().__init__(surface, myfont, fore_ground, position, message)
        super().draw()

        clock.tick(30)

if __name__ == '__main__':
    main()
    pygame.quit()
```

Text Display Project

LECTURE 1

Display Text with Button, Label and TextBox

- Label is a single Text Message.

- TextBox is a rectangle area with multiple line of text messages. Usually, it is scrollable. But in game system, it is not required to be scrollable.

- Button is a Label which can be clicked to take action.

```python
import pygame
def __pygamebox(title, message):
    pygame.quit()  # clean out anything running
    pygame.display.init()
    pygame.font.init()
    root = pygame.display.set_mode((460, 140))
    pygame.display.set_caption(title)
    font = pygame.font.Font(None, 18)
    foreg, backg, liteg = (0, 0, 0), (180, 180, 180), (210, 210, 210)
    ok = font.render('Quit', 1, foreg, liteg)
    okbox = ok.get_rect().inflate(200, 10)
    okbox.centerx = root.get_rect().centerx
    okbox.bottom = root.get_rect().bottom - 10
    root.fill(backg)
    root.fill(liteg, okbox)
    root.blit(ok, okbox.inflate(-200, -10))
    pos = [10, 10]
    for text in message.split('\n'):
        if text:
            msg = font.render(text, 1, foreg, backg)
            root.blit(msg, pos)
        pos[1] += font.get_height()
    pygame.display.flip()
    stopkeys = pygame.K_ESCAPE, pygame.K_SPACE, pygame.K_RETURN, pygame.K_KP_ENTER
    while 1:
        event = pygame.event.wait()
        if event.type == pygame.QUIT or \
                (event.type == pygame.KEYDOWN and event.key in stopkeys) or \
                (event.type == pygame.MOUSEBUTTONDOWN and okbox.collidepoint(event.pos)):
            break
    pygame.quit()

__pygamebox("Font 1", "Hello! \nHow are you?")
```

eC Learning Channel
